

CLAIMS

That which is claimed is:

1. A device for cleansing body parts, said device comprising:
a base portion;
a pair of side wall portions extending upwardly from said base portion, each said side wall portion having an inner wall surface facing the other;
first scrubbing means mounted on said inner wall surfaces;
second scrubbing means mounted on an upper surface of said base portion and extending between said first scrubbing means of said inner wall surfaces; and
a cleansing material support biased with respect to said base portion and positioned to support cleansing material at a height to readily make contact with a users foot as a user slides the foot over said second scrubbing means.
2. The device of claim 1, wherein said cleansing material support extends to a level slightly lower than a top surface of said second scrubbing means, thereby preventing sliding of the cleansing material during use.
3. The device of claim 1, wherein said cleansing material support is upwardly biased by at least one coil spring.
4. The device of claim 1, wherein said first scrubbing means comprise bristles.
5. The device of claim 1, wherein said second scrubbing means comprise bristles.
6. The device of claim 1, further comprising cleansing material mounted on said cleansing material support.
7. The device of claim 6, wherein said cleansing material comprises a bar of soap.

8. The device of claim 1, further comprising at least one suction cup extending from the device and adapted to fix the device to a stationary object.

9. The device of claim 1, wherein at least one of said at least one suction cup extends from a bottom surface of said base portion.

10. A method of washing a foot, said method comprising the steps of:
providing a cleansing device having a scrubbing surface and cleansing material biased so as to extend above the scrubbing surface;
contacting the foot with the scrubbing surface; and
sliding the foot to pass over the cleansing material.

11. The method of claim 10, further comprising continuing to slide the foot in a same direction, wherein cleansing material is applied to the foot as it passes over the cleansing material, and wherein the foot is scrubbed after passing the cleansing material and contacting the scrubbing surface.

12. The method of claim 12, further comprising sliding the foot in a reverse direction, wherein the scrubbing surface is provided on opposite sides of the cleansing material so that the foot contacts the scrubbing surface after passing over the cleansing material in either direction.

13. The method of claim 10, further comprising maintaining a top surface of the cleansing material above the scrubbing surface, even as the cleansing material diminishes through use.

14. The method of claim 10, wherein the cleansing device further includes side scrubbing surfaces extending substantially perpendicularly to the scrubbing surface, said method further comprising sliding a portion of the foot against at least one of the side scrubbing surfaces.
